To Whomsoever It May Concern

We engaged REVY team at a critical stage when one of our Biogas / CBG plant site was experiencing persistently high H₂S levels, impacting both gas quality and operational stability. REVY team provided a highly scientific and structured approach, combining technical diagnostics with targeted product and process interventions. What stood out was their ability to quickly identify root causes and implement practical, plant-specific solutions rather than generic recommendations.

Within a short span of 2 – 3 weeks from the start of their intervention in mid of September 2025, we observed a significant reduction in H₂S levels, bringing the system back within acceptable operational limits. This improvement was achieved without much disruption to ongoing plant operations, reflecting their strong understanding of biological systems and process sensitivities.

Beyond the initial stabilization, REVY has continued to provide consistent day-to-day guidance on feedstock management, process optimization and maintaining overall digester health. Their ongoing support has not only helped sustain lower H₂S levels but has also contributed to improved biogas yield and overall plant efficiency.

We value their responsiveness, technical depth and commitment to long-term performance improvement and consider REVY a reliable partner in optimizing our biogas operations.

Yours Sincerely,

For Transtech Green Power Pvt. Ltd.

Amitabh Tandon
Director
